1. Executive Summary

This report walks through the MIS Job Market Dashboard's findings: 50,942 MIS-related job postings pulled from 11,322 companies, 26 industries, and 600 cities. It's the analysis itself, not a strategy document. A companion report, the Placement Support Solution Report, takes these findings and turns them into action for ACC. This one just lays out what the data actually shows.

The dashboard is organised around three questions. Market Overview covers where the hiring is happening: which companies, industries, departments, and types of organisations are posting. Skills Analysis covers what it takes to get hired: the tools, soft skills, education levels, and roles the market is actually asking for. Salary Analysis covers what it pays. Those three questions structure both the dashboard and this report.

A handful of numbers carry most of the story. Financial MIS Executive is the single most-demanded role in the dataset. Ten companies and three industries account for a large share of all hiring. Only 14.9% of postings are open to freshers. Excel and Communication top their respective skill rankings by a wide margin, and the average salary of ₹3.98 lakh sits well above the median of ₹3 lakh, a sign that a handful of high-paying postings are pulling the average up. Each of these gets its own chart and its own section below.

Metric	Value
Total MIS Jobs	50,942
Companies	11,322
Cities	600
Industries	26
Departments	7
Company Types	6

2. Introduction

Importance of MIS Job Market Analysis

MIS hiring is an odd market to plan for. It's big enough to generate tens of thousands of postings, but a student's actual outcome depends on details most people never check: which of the 20 tracked titles they go after, which tools they've genuinely learned, which industries are hiring for their profile. Most placement guidance runs on general impressions instead of the data itself, and general impressions don't tell you that Banking alone posts more roles than the next five industries combined, or that five specific titles account for most of the fresher hiring. That's the gap this analysis is meant to close.

Objectives of the Dashboard

The dashboard was built to do five things: size up how much MIS hiring exists and where, work out which companies, industries, and departments are driving it, rank the skills and qualifications employers actually ask for, benchmark what the roles pay, and put all of it in a format ACC's team can use directly instead of digging through raw listings every time a question comes up.

Scope of the Analysis

The dataset behind this report covers 50,942 postings pulled from major job portals: 11,322 companies, 26 industries, 600 cities, six company types. It's a snapshot of a specific window, not a live feed, so the numbers describe hiring activity as it stood when the data was collected. Section 9 covers what that means in practice.

Data Sources & Methodology

The underlying data was compiled by ACC's Data Vanguard team through a six-stage pipeline, taking every posting from a raw scrape to a report-ready figure. Each stage feeds the next, and every chart in this report is built directly on top of the output of stage six.

- **Web scraping:** Job postings were pulled from major Indian job portals using Selenium and BeautifulSoup, handling dynamic page loads and parsing the raw HTML into structured records.
- **Data cleaning:** Excel and Python (pandas) were used to deduplicate records, standardise job titles, parse locations and salaries, and classify skills into a consistent schema.
- **Data storage:** The cleaned dataset was stored and managed in Google Sheets, giving the team a live, shared source of truth to update as new postings came in.
- **Dashboard creation:** Looker Studio was connected to the live sheet to build the interactive dashboard, which is the source for every chart referenced in this report.
- **Reporting:** Findings were compiled into this report in Google Docs, translating the dashboard's charts into the written analysis and recommendations that follow.
- **Presentation:** Key findings were packaged into a PowerPoint deck for stakeholder-facing walkthroughs of the results.

Why the Dashboard Was Developed

Before this existed, ACC didn't have a single structured source for MIS hiring data, just an informal sense of the market built up posting by posting. The dashboard replaces that with something the team can actually query: the same underlying data, organised around the questions a placement or training team needs answered, rather than whatever order the postings happened to get scraped in.

Key Business Questions It Answers

- Which industries, companies, and departments drive the most MIS hiring?
- Which job titles are worth targeting, and which ones are actually open to freshers?
- Which technical and soft skills come up most, and what should that mean for training?
- What can a student realistically expect to earn, by role, industry, experience, and city?
- Where is hiring actually happening geographically, and does ACC's current focus match it?

3. Dashboard Overview

3.1 Dashboard Objectives

At its core, the dashboard answers three things for any MIS job title: how much demand exists and where, what it takes to get hired, and what it pays. Every chart in it maps back to one of those three questions, which is why both the dashboard and this report split cleanly into Market Overview, Skills Analysis, and Salary Analysis.

3.2 Dashboard Components

Market Overview covers where the jobs are: companies, industries, departments, organisation types. Skills Analysis covers what gets someone hired: technical skills, soft skills, education, and which roles are actually in demand. Salary Analysis covers the outcome, what the pay looks like once the first two questions are answered. The KPIs below are the base numbers all three sections draw from.

KPI	Value
Total MIS Jobs	50,942
Companies	11,322
Cities	600
Industries	26
Departments	7
Company Types	6

4. Market Overview Analysis

4.1 Overall Job Market

50,942 postings, 11,322 companies, 600 cities. That's a large enough sample that the patterns in it aren't noise, and spread wide enough that MIS hiring clearly isn't concentrated in a handful of employers or locations. "Spread wide" doesn't mean spread evenly, though, as the next few sections show.

4.2 State-wise Hiring Analysis

The dashboard maps every posting by city, and the picture that comes out is hiring clustered near India's major commercial centres, with a long tail reaching into roughly 600 cities in total, a wider spread than the metro-focused picture most placement planning tends to assume. That tail matters more than it looks: several of the highest salary ranges in the whole dataset show up in non-metro cities, not the metros. More on that in Section 6.5.

4.3 Company Analysis

Ten companies sit at the top of the hiring list. Accenture leads by a wide margin at 1,400 postings, more than three times the next name on the list. Deutsche Bank and JP Morgan follow. Look at the list as a whole and a pattern shows up fast: it's mostly large banks (Deutsche Bank, JP Morgan, Barclays) and Big-4 or consulting firms (EY, Deloitte, Ernst & Young). That's not a coincidence, and it explains a lot of what turns up in the industry numbers next.

Figure 4.3 — Top 10 Hiring Companies by job posting volume

4.4 Industry Analysis

Banking posts 8,800 of the jobs in this dataset, almost double Consulting's 4,500 and more than the next five industries put together. Manufacturing, Healthcare, and Real Estate make up a second tier below that. Logistics, E-commerce, IT Services, EdTech, and BFSI (Banking, Financial Services, and Insurance) sit closer together in a third tier. Out of 26 industries tracked, three of them, Banking, Consulting, and Manufacturing, do most of the work.

Top Hiring Industries

Figure 4.4 — Top 10 Hiring Industries by job posting volume

4.5 Department Analysis

Inside the companies posting these roles, MIS is clearly the biggest department on its own. MIS accounts for an estimated 57.3% of postings, Finance 21.9%, Sales 11.5%, HR 4.1%, Operations 2.7%, and Supply Chain 2.4%. The takeaway holds regardless of the exact split: MIS isn't a small support function tucked inside other departments in this dataset, it's the department generating the demand, and Finance and Sales are the two functions leaning on MIS people the most.

Hiring by Department — Estimated Share

Figure 4.5 — Hiring by Department, estimated share by treemap block area

4.6 Company Type Analysis

Private companies post 95.1% of everything in this dataset. SME (Small and Medium Enterprises, 2.4%), Public (2.0%), MNC (Multinational Corporation, 0.5%), and Startup/Enterprise combined (0.1%) barely register next to that. It's a number worth sitting with, because a lot of placement thinking still defaults to landing students at a recognisable MNC, and that's a target that barely exists in this particular market.

Company Type Share

Figure 4.6 — Company Type Share across all postings

Work mode follows a similar pattern once you break it out by company type. Among Private postings that specify a mode, Hybrid and On-site both show up heavily and Remote trails a distant third. SME and Public postings lean on-site even more, and Startup/Enterprise listings are almost entirely on-site wherever a mode is given at all.

Company Type	Hybrid	On-site	Remote
Private	7,200	5,500	1,500
Public	281	228	38
SME	3	449	40
MNC	24	85	14
Startup	—	12	—
Enterprise	—	8	—

5. Skills & Career Analysis

5.1 Technical Skills Analysis

Excel isn't just the top technical skill in this dataset, it isn't close. Reporting comes in second, and after that SQL, Power BI, and Data Analysis form a fairly tight second tier, each showing up across a solid majority of postings that name a technical skill at all. Python and Tableau sit lower down the list, which fits: they're more specialised tools, useful for standing out rather than something every posting expects by default. Across the whole dataset, technical skills get mentioned 29,769 times, spread across these ten tools.

Figure 5.1 — Top 10 Technical Skills in Demand

5.2 Soft Skills Analysis

Communication tops the soft skills list by more than double the runner-up, Attention to Detail. Coordination and Stakeholder Management follow, then Analytical Skills. Below that sits a more closely bunched group: Problem Solving, Presentation Skills, Process Improvement, Time Management, Organizational Skills. It makes sense once you think about what an MIS role actually does day to day, which is turn data into something someone else can act on. Producing the number and explaining it clearly aren't treated as separate skills in this market. Employers seem to weight them about the same.

Top 10 Soft Skills in Demand

Figure 5.2 — Top 10 Soft Skills in Demand

5.3 Education Analysis

A Bachelor's degree dominates the roughly 30 education categories the dashboard tracks, by a wide margin. MBA and Master's-level qualifications form a smaller second tier, and B.E., commerce/CA-track, and Diploma-level qualifications sit further down still. The dashboard shows this as a relative distribution rather than exact counts, but the shape of it is clear enough: this is a Bachelor's-degree market first, where a postgraduate qualification helps someone move faster rather than being required to get in the door.

5.4 Job Role Analysis

Twenty distinct MIS titles show up in this dataset, and Financial MIS Executive comes out as the single most in-demand of them across all experience levels, which tracks given how much Banking dominates the industry numbers. That ranking shifts once it's narrowed down to roles freshers can actually get, which is what the next section covers.

5.5 Fresher Hiring Analysis

Freshers make up 14.9% of hiring overall, and within that slice, five titles do most of the work: MIS Analyst with 699 openings, Financial MIS Executive with 553, Sales MIS Executive with 374, Data MIS Executive with 314, and Business Information Executive with 257. Together those five account for roughly three-quarters of the top ten fresher-tagged roles on the dashboard, a much shorter and more useful list than the full 20-title field.

Top 10 Job Roles for Freshers

Figure 5.5 — Top 10 Job Roles for Freshers

5.6 Experience Requirement Analysis

85.1% of postings want someone with experience already. Only 14.9% are open to freshers. This is probably the single most important number in the whole dataset for anyone advising a student who's about to graduate: most of what looks like open demand simply isn't available to a first-time applicant, and any realistic plan has to be built around that smaller slice rather than the headline total.

Fresher vs Experienced Hiring

Figure 5.6 — Fresher vs Experienced Hiring

6. Salary Analysis

6.1 Salary Overview

Average reported salary comes out to ₹3,98,417.8. Median is ₹3,00,000. That gap tells its own story: a right-skewed distribution, where a relatively small number of high-paying postings, up to the reported ceiling of ₹50,00,000, drag the average up above what a typical listing actually pays. The most common range, ₹2,00,000 to ₹5,00,000, is a better benchmark than the average for what most MIS postings actually offer. Keep in mind, too, that only 10,678 of the 50,942 postings, about 21%, disclose salary at all. Everything in this section is based on that smaller, disclosed group, not the full dataset.

Figure 6.1 — Salary Overview (log scale, reported figures)

6.2 Salary by Experience

Average pay climbs from ₹1.67 lakh at fresher level to ₹6.96 lakh at 5+ years, roughly the shape you'd expect. There's one dip that doesn't fit the pattern: the 1–3 year band drops to ₹0.99 lakh, actually lower than the fresher figure, before recovering at 3–5 years. That could be a real feature of this segment of the market, a lot of competition at that particular stage, or it could reflect a thinner sample behind that one data point. Either way, it's worth checking against actual fresher outcomes rather than taking at face value.

Average Salary by Experience Level

Figure 6.2 — Average Salary by Experience Level

6.3 Salary by Industry

Banking tops this list too, which lines up with it topping the demand numbers. Consulting and Manufacturing follow. IT Services and Healthcare land close together in the middle, Real Estate just behind them, and E-commerce and Logistics report the lowest average pay of the industries shown. Set next to the industry-demand chart in Section 4.4, the two line up: the industries hiring the most also tend to pay the most, rather than one trading off against the other.

Average Salary by Industry

Figure 6.3 — Average Salary by Industry

6.4 Salary by Job Role

Financial MIS Executive and Ops MIS Executive report the highest average pay of the roles tracked, with Sales MIS Executive close behind. MIS Analyst lands close enough to the dataset's overall median that it works as a decent stand-in for typical MIS pay. Data MIS Executive, Business Information Executive, and HR MIS Executive report progressively lower averages below that. One role, MIS Executive, didn't have a clearly readable value in the source export, so it's left out of the chart rather than guessed at.

Average Salary by Job Role

Figure 6.4 — Average Salary by Job Role

6.5 Salary by City

The highest salary ranges in this entire dataset aren't in the metros. They're in a cluster of tier-2/3 industrial towns: Bawal, Neemrana, Bhillai, Angul, Durgapur, all reporting ranges that reach ₹24–29 lakh. The likeliest explanation is a handful of senior or plant-specific postings in each of these cities rather than typical entry-level pay, but the finding still holds up. Geographic salary opportunity in this market doesn't follow the metro-versus-everywhere-else assumption most students start with.

Salary Range by City — Notable Tier-2/3 Hubs

Figure 6.5 — Salary Range by City, notable tier-2/3 hubs

6.6 Salary by Company Type

The dashboard also breaks salary down by company type, but those particular numbers don't line up with the rest of the dataset. Private-sector figures come out far higher than they should, given that Private companies post 95.1% of all listings and ought to track close to the overall average rather than sit well above it. Rather than chart something that might misrepresent the underlying data, this section just says so directly. What can be said

with confidence is that because Private-sector postings make up almost the entire dataset, they're also driving almost every other salary figure reported in this section.

7. Key Business Insights

Put together, the sections above boil down to ten findings that matter most for how ACC uses this data:

- Overall hiring trends: 50,942 postings across 11,322 companies is a large market, but a narrow one in practice. Real opportunity sits in a small number of roles, employers, and industries rather than spreading evenly.
- Industry demand: Banking, Consulting, and Manufacturing cover a disproportionate share of the 26 industries tracked. Banking alone comes close to matching the next five industries combined.
- Department-wise recruitment: MIS is the dominant department generating this demand in its own right. Finance and Sales are the two functions leaning on MIS people the most beyond that.
- Company hiring behaviour: ten companies, led by Accenture, sit at the top of the recruiter list. Private-sector organisations post 95.1% of everything; MNC and Startup hiring barely register by comparison.
- Role demand: Financial MIS Executive is the single most in-demand title overall. Among fresher-accessible roles specifically, MIS Analyst leads, and five titles together cover roughly three-quarters of fresher demand.
- Skill priorities: Excel and Communication top their rankings by a wide margin. SQL, Power BI, and Data Analysis make up the next technical tier; Attention to Detail, Coordination, and Stakeholder Management make up the next soft-skill tier.
- Educational preferences: a Bachelor's degree is the dominant baseline. MBA and Master's-level credentials help someone move faster, but they aren't the entry requirement.
- Experience requirements: 85.1% of postings target experienced candidates, leaving only 14.9% genuinely open to freshers. This is the single fact that matters most for placement planning.
- Salary patterns: the average (₹3.98L) sits well above the median (₹3L). The ₹2–5L range is the realistic benchmark, not the average.
- Geographic opportunities: hiring spans 600 cities, and several non-metro industrial hubs report some of the highest salary ranges in the whole dataset.

8. Recommendations

For Students

- Start with the skills that top the demand rankings: Excel, Reporting, SQL, Power BI, and Data Analysis, alongside Communication and Attention to Detail, before branching into anything more specialised.
- Target the roles and industries the data actually points to: the five fresher-accessible titles from Section 5.5, inside Banking, Consulting, and Manufacturing, where both demand and pay are strongest.
- Build skills around what employers are actually asking for, using the ranked lists in Section 5, rather than a generic analytics skillset picked up secondhand.

For Training Institutions

- Build curriculum around the market-demand rankings in this report, especially the technical skill ranking in Section 5.1, instead of a standard, one-size-fits-all analytics syllabus.
- Give soft skills equal weight to technical ones. The dataset rates Communication as highly as any single tool, and a curriculum that only teaches tools will miss that.

For ACC

- Use these findings to guide placement planning directly. Put outreach effort behind the industries and companies shown in Sections 4.3 and 4.4, where hiring demand is strongest.
- Base student support on what the market currently looks like, not on older assumptions about MIS hiring, and refresh this analysis as new data comes in.

10. Conclusion

On their own, fifty thousand job postings are just noise: too much for any placement team to read manually, too unstructured to act on directly. What this report has done is turn that into ten specific findings that can actually be checked, which industries and companies are driving MIS hiring, which of the twenty tracked roles a fresher can realistically get, which skills separate a strong application from a weak one, and what a graduate should actually expect to earn.

None of these findings are complicated by themselves. What makes them useful is that they replace guesswork with evidence: Banking's dominance, the short list of fresher-accessible roles, how much weight Excel and Communication carry, the gap between average and median pay. A placement team could otherwise only guess at most of this. The companion Placement Support Solution Report takes each of these findings and turns it into something ACC and its students can act on. This report's job was just to make sure that action is standing on solid ground.
