1. Executive Summary

This report translates the MIS Job Market Dashboard into a placement plan ACC can actually use. The dashboard covers 50,942 MIS-related job postings across 11,322 companies, 26 industries, and 600 cities. Where the dashboard shows what the market looks like, this report is about what to do with that.

It's a market that's large in volume but narrow in structure. Only 20 distinct MIS job titles compete for attention. 85.1% of hiring goes to experienced candidates. A concentrated set of roughly ten employers and three industries account for a disproportionate share of demand. Rather than offer generic career advice, this report uses those specific patterns to build role-by-role roadmaps for the five titles where freshers are actually getting hired, and to lay out what ACC needs to change in training, counselling, and placement to work against this real market instead of an assumed one.

Every recommendation that follows traces back to a number on the dashboard. The table below summarises the core figures referenced throughout the report.

Metric	Value
Total MIS Job Postings Analyzed	50,942
Companies Represented	11,322
Industries Covered	26
Cities Covered	600
Unique MIS Job Titles	20
Fresher-Level Hiring Share	14.9%
Experienced-Level Hiring Share	85.1%
Average Salary (All Roles)	₹3,98,418 (~₹3.98 LPA)
Median Salary	₹3,00,000 (~₹3 LPA)
Most Common Salary Range	₹2,00,000 – ₹5,00,000
Postings with Salary Disclosed	10,678 of 50,942 (21%)

2. Introduction

Background of the Project

Analytics Career Connect (ACC), a Campus2Corporate initiative, commissioned the MIS Job Market Dashboard to move placement guidance away from anecdotal advice and toward something more solid. The dashboard pulls together job postings across the whole MIS job family, financial, sales, data, operations, HR, and reporting-focused titles alike, into one queryable view of demand, skills, education, and pay. This report is the second deliverable built on that foundation. It doesn't repeat the dashboard's analysis. It turns it into action.

Data Sources & Methodology

The underlying dataset, 50,942 postings across 11,322 companies, 26 industries, and 600 cities, was compiled by ACC's Data Vanguard team through web scraping of major Indian job portals, then cleaned and standardised into a consistent schema. Every figure in this report traces back to that same dataset. The companion MIS Job Market Analysis & Insights Report covers the full methodology and the dashboard's own findings in more depth; this report assumes that foundation and focuses on what to do with it.

Importance of Data-Driven Placement Support

With 20 job titles, 26 industries, and salary figures that range from a few thousand rupees to a reported ceiling of ₹50,00,00, the MIS space is too fragmented for placement advice to rest on generalities. A student told simply to "apply for MIS jobs" is up against a market where 85.1% of postings favour experienced candidates, and where four industries, Banking, Consulting, Manufacturing, and Healthcare, account for most of the hiring. Without the dashboard, neither the student nor ACC can really see which of the 20 titles, which employers, and which skills represent an actual path in. With it, both can.

Objectives of Developing the Solution

The point of this report isn't to restate what the dashboard already shows. It's to turn that into something ACC and its students can act on. That means two separate but connected sets of objectives: one for how ACC runs training, counselling, and placement, and one for how a student navigates their own job search.

Objectives for Analytics Career Connect (ACC)

- Align training programs with current industry demand and hiring trends.
- Design role-specific learning paths based on the skills employers actively seek.
- Enhance career counselling through data-driven guidance instead of assumptions.
- Identify high-demand industries, departments, companies, and job roles for targeted placement efforts.
- Support resume building, portfolio development, and interview preparation using market insights.
- Improve placement planning by focusing on industries and employers with strong recruitment demand.
- Strengthen employer engagement by understanding hiring preferences and workforce requirements.
- Enable informed decision-making for placement support services through dashboard-driven insights.

Objectives for Students

- Understand current job market trends and employment opportunities.
- Identify high-demand job roles, industries, and career paths.

- Prioritize the technical and soft skills most valued by employers.
- Build role-specific learning plans based on actual market requirements.
- Develop industry-relevant projects and portfolios.
- Prepare effectively for recruitment processes through targeted interview preparation.
- Set realistic salary expectations and understand career growth opportunities.
- Make informed career decisions using data rather than assumptions.

3. Problems Identified

The Job Market Analysis surfaces five recurring problems that get in the way of students and ACC acting effectively on the MIS job market.

Skill Gap Between Students and Industry Requirements

The dataset records 29,769 technical-skill mentions and 50,865 soft-skill mentions, averaging 8.36 skills per posting. Postings aren't asking for one or two tools. Excel, Reporting, SQL, Power BI, Data Analysis, Dashboards, Python, and Tableau all appear independently among the top ten technical skills. A curriculum that teaches Excel alone, without SQL, Power BI, and at least foundational Python, leaves students short of what a typical posting actually expects.

Lack of Awareness of High-Demand Job Roles

The dashboard identifies 20 distinct MIS job titles. Most students walking into placement conversations only know the generic label "MIS Executive." That means they usually don't realise that Financial MIS Executive, MIS Analyst, Sales MIS Executive, Data MIS Executive, and Business Information Executive are separately trackable roles with different skill requirements, different industries, and different pay, and that these five specifically account for most of the fresher-level openings.

Difficulty Identifying Top Hiring Companies and Industries

With 11,322 companies and 26 industries in the data, the market is too fragmented for students to navigate on their own without a shortlist. The dashboard narrows it down: Banking, Consulting, and Manufacturing alone account for roughly 16,000 of the 50,942 postings, and ten employers, led by Accenture at 1,400 postings, dominate the top of the recruiter list. Students applying without this narrowing are searching blind across an 11,000-company field.

Limited Understanding of Salary Trends

Only 10,678 of 50,942 postings, 21%, disclose salary information, and the numbers that are disclosed vary a lot, from a reported low in the low thousands to a high of ₹50,00,000. The average salary of ₹3.98 lakh sits well above the median of ₹3 lakh, which tells you the distribution gets pulled up by a small number of high-paying outliers. Without seeing that pattern, students tend to anchor on whatever figure they run into first, whether it's unrealistically low or unrealistically high.

Ineffective Career Planning for Fresh Graduates

Freshers make up only 14.9% of hiring against 85.1% for experienced candidates. That means most postings in this dataset simply aren't accessible to a first-time applicant, no matter how well they interview. Without knowing that, freshers end up applying broadly across all 20 titles instead of concentrating on the roles the data shows are actually open to entry-level candidates.

4. Solution for Students

This section turns the problems above into a decision path for students: which career direction to choose, which skills to prioritise, what a realistic roadmap looks like for the five highest-opportunity roles, how to search strategically, and how to plan around real salary data instead of guesswork.

4.1 Career Planning

Career planning in this market starts with picking a title, not just a function. Since only 14.9% of postings go to freshers, the single highest-leverage decision a student can make is choosing one of the roles the dashboard shows is genuinely open at entry level, instead of treating all 20 MIS titles as equally reachable.

Choosing a Career Path Based on Market Demand

The five roles profiled in Section 4.3 aren't a random shortlist. Together they account for roughly 75% of the top ten fresher-tagged openings in the dataset, which makes title selection the single highest-leverage decision in this whole process. And it isn't a neutral choice. Financial MIS Executive and Business Information Executive point a student toward Banking and Consulting employers; Data MIS Executive points toward IT Services and EdTech instead. Picking a title is really picking an industry lane before a single application goes out.

Identifying Suitable Companies

A usable shortlist already exists in the dashboard's top ten recruiters: Accenture, Deutsche Bank, JP Morgan, Newage Tech Soln Pvt, HR Consult., EY, Turing, Barclays, Ernst & Young, and Deloitte. Treat it as a starting point rather than researching the market from scratch. Company-type expectations need recalibrating too. Private-sector employers account for 95.1% of postings, so a student holding out for a recognisable MNC (Multinational Corporation) brand or a startup is chasing a segment that barely registers here. The realistic target is a mainstream private employer, not a marquee name.

Selecting Preferred Industries

Banking, Consulting, and Manufacturing carry the largest share of demand, and, going by the dashboard's salary-by-industry numbers, they also tend to pay above the market average. So there's little real trade-off between volume and pay at the top of this list. Healthcare, Real Estate, and Logistics form a credible second tier, worth keeping open especially for students leaning toward Sales MIS Executive or Business Information Executive rather than a finance-specific track.

Choosing Target Locations

The dataset spans 600 cities, so metro-only searching is a self-imposed limit, not a market reality. A handful of tier-2/3 industrial hubs, Bawal, Neemrana, Bhillai, Angul, and Durgapur among them, show salary ranges well above what students typically expect outside the metros, most likely tied to plant-based Manufacturing MIS postings. Section 4.5 goes deeper on this, but it belongs here too, as a genuine planning input rather than a footnote.

Planning Long-Term Growth

Each of the five role roadmaps in Section 4.3 ends with a specific, researched growth path instead of a generic instruction to grow one's career. Financial MIS Executive branches toward FP&A or stays inside reporting, for instance; Data MIS Executive moves fairly directly toward a Data Analyst track. Treating growth as role-specific from day one avoids a common mistake: picking a first job on entry-level fit alone, and only thinking about the next five years once you're already inside it.

4.2 Skill Planning

With an average of 8.36 skills expected per posting, skill planning needs to be deliberate and stacked, not opportunistic. The dashboard's top ten technical and soft skills give a direct, ranked priority list to work from.

Understanding Required Qualifications and Experience

A Bachelor's degree is the baseline qualification across the dataset's education categories. MBA, Master's, B.E., and CA form a smaller but meaningful tier of differentiators. An MBA in particular strengthens candidacy for Financial MIS Executive and Business Information Executive specifically.

Learning the Most Demanded Technical and Soft Skills

The tables below rank technical and soft skills by how often they show up across the 50,942 postings analysed.

Technical Skill	Demand (mentions)
Excel	18,700
Reporting	11,000
SQL	8,900
Power BI	7,700
Data Analysis	7,300
Dashboards	6,900
Python	5,500
Tableau	4,900
Pivot Tables	4,400
MS Office	4,300

Soft Skill	Demand (mentions)
Communication	9,600
Attention to Detail	4,600
Coordination	3,700
Stakeholder Management	3,000
Analytical Skills	2,400
Problem Solving	1,000
Presentation Skills	988
Process Improvement	956
Time Management	923
Organizational Skills	860

Prioritising Skills According to Industry Demand

Not all ten technical skills carry equal weight, and treating them as one flat checklist wastes study time that could go elsewhere. Excel, Reporting, and Pivot Tables sit in a non-negotiable baseline tier. Excel alone outranks every other technical skill by a wide margin, and a student who hasn't mastered it isn't ready for any of the five target roles, whatever else they know. SQL, Power BI, and Data Analysis make up a second tier required across most of the five roles, not just the technically-focused Data MIS Executive track. Python and Tableau, by contrast, are differentiators rather than baseline requirements, worth prioritising specifically by students aiming at Data MIS Executive.

For ACC's training design, this ranking should directly determine module weighting. Section 5.1 covers how that translates into curriculum decisions.

4.3 Career Roadmap for Top 5 Roles

The five roles below are the dashboard's top five fresher-tagged titles, together accounting for 2,197 of the 2,933 fresher openings recorded across the ten roles the dashboard tracks for freshers, roughly 75% of all fresher-accessible demand. Each roadmap is built from the dashboard's role-specific signals: fresher volume, associated skills, salary position, and the industries and companies most likely to be hiring for that title.

Role	Fresher Openings (Dashboard)
MIS Analyst	699
Financial MIS Executive	553
Sales MIS Executive	374
Data MIS Executive	314
Business Information Executive	257

4.3.1 Financial MIS Executive

Dashboard fresher openings: 553

Role Overview

Financial MIS Executive is the single most-demanded title on the entire dashboard, and the second-largest fresher entry point at 553 openings. Strip away the job-portal language and the work is concrete: monthly and quarterly MIS packs, tracking budget against actual spend, reconciling accounts, getting numbers audit-ready before they land on a finance head's desk. It's a deadline-driven role built around the close cycle. Not a general-purpose reporting job.

Why the Demand Is Concentrated Here

Banking alone posts 8,800 of the jobs in this dataset, the largest single industry by a wide margin, and three of the top ten recruiters (Deutsche Bank, JP Morgan, Barclays) are banks. Every bank, NBFC, and BFSI-adjacent (Banking, Financial Services, and Insurance) consulting engagement needs someone producing finance MIS on a fixed monthly rhythm. That's really the whole reason this one title outranks every other role in raw demand.

Industries Recruiting for This Role

- Banking

- BFSI
- Consulting (finance-transformation engagements)
- Manufacturing (plant finance and controlling)

Types of Companies Hiring

Almost entirely private-sector, matching the dataset's 95.1% private-sector share. Large banks and NBFCs hire directly into finance MIS teams; Deutsche Bank, JP Morgan, and Barclays all show up here. The Big-4 and consulting firms hire similar profiles onto banking and BFSI client engagements instead.

Required Technical Skills

- Advanced Excel: VLOOKUP/XLOOKUP, pivot tables, basic macros. Non-negotiable for this role.
- Working exposure to at least one ERP system (SAP FI/CO, Tally, or Oracle Financials are the most common in Indian mid-to-large employers)
- MIS pack and reporting-pack construction
- Power BI for finance dashboards, layered on top of Excel-prepared data
- Basic SQL, for pulling data directly from finance systems instead of relying on manual exports

Required Soft Skills

- Attention to Detail (2nd most in-demand soft skill dataset-wide)
- Time Management, because close-cycle deadlines don't move
- Stakeholder Management
- Communication, especially explaining a variance to a non-finance audience

Educational Background

A Bachelor's in Commerce or Finance is the most common entry point here, matching the dataset's dominant education category overall. An MBA in Finance is the clearest differentiator for faster progression. Candidates part-way through CA or CMA often use this role as a paid stepping stone while they finish qualifying.

Experience Expectations

553 fresher openings makes this one of the two most accessible titles on the dashboard for a first-time applicant. That accessibility narrows fast, though. The salary-by-experience data shows a clear step-up past the 3–5 year mark, which is also roughly when employers start expecting independent ownership of the close cycle instead of supervised report preparation.

Step-by-Step Learning Path

1. Get fluent in Excel beyond the basics: VLOOKUP/XLOOKUP, pivot tables, simple macros. This is the floor every employer screens for first.
2. Learn how a monthly financial close actually works. Accruals, provisions, and why last month's numbers sometimes get restated.
3. Get hands-on with at least one ERP system. SAP FI/CO, Tally, and Oracle Financials are the three most commonly named in Indian job postings for this title.
4. Layer Power BI on top of Excel-prepared data to build an actual finance dashboard, not just a static report.
5. Practise variance analysis specifically. Compare budget to actual and write the explanation, not just the number.

6. Work toward the Microsoft Office Specialist: Excel Expert certification (exam MO-211). It puts a formal credential behind the Excel skillset employers test for first.

Recommended Projects

- Build a 12-month rolling budget-vs-actual tracker with automatic variance flags for anything outside a set threshold.
- Simulate a month-end close checklist and reconciliation workbook for a mock company with intentionally messy source data.
- Build a receivables-ageing dashboard in Power BI, sourced from a mock ERP export, with drill-down by customer and overdue bracket.

Resume Guidance

Lead with Excel, ERP exposure, and variance analysis, by name. If you've touched Banking or BFSI in any capacity, even a case study or internship, say so explicitly. That's the industry actually driving demand for this title.

Interview Preparation

Expect a timed, hands-on Excel test (building a pivot table or a VLOOKUP live is common), a walk-through of a sample MIS pack, and a scenario question along the lines of: a cost line came in 12% over budget, how would you investigate it? That second question is testing reasoning, not recall. Practise narrating your thought process out loud, not just producing the right number.

Career Growth Opportunities

The role splits into two credible paths from here. Financial MIS Executive to Senior MIS Executive, and then either toward FP&A (adding budgeting, forecasting, and management commentary to move into a Financial Planning & Analysis or Budget Analyst role), or staying inside reporting via MIS Analyst to Business Intelligence Analyst to Analytics Manager. Which branch makes sense depends on whether you enjoy the finance-specific content or the reporting mechanics more. Both are realistic from this starting point.

4.3.2 MIS Analyst

Dashboard fresher openings: 699

Role Overview

MIS Analyst is the largest single fresher category on the dashboard: 699 openings, more than any other title tracked. It's deliberately the generalist role. Instead of owning one department's numbers, an MIS Analyst is the person a manager calls when they need data pulled and explained, regardless of which function it comes from. Think of it as the utility-player position in the MIS family.

Why the Widest Door Matters

With only 20 job titles covering the entire MIS space, breadth is itself an advantage for a first-time applicant. More postings fit a generalist profile than a specialist one, and MIS Analyst draws on the full top-ten technical skill stack rather than one narrow slice of it. That's exactly why it produces the highest fresher volume on the dashboard, and it genuinely spans most of the top industries rather than concentrating in two or three.

Industries Recruiting for This Role

- Banking
- Consulting
- Manufacturing
- IT Services

Types of Companies Hiring

Broad private-sector spread, but one name is worth calling out on its own. Accenture is the single largest recruiter on the entire dashboard, at 1,400 postings, and a services organisation that size hires exactly this kind of generalist reporting profile at volume, for internal operations and client-facing work alike.

Required Technical Skills

- Excel
- SQL, for pulling data directly rather than relying on exports
- Power BI
- Data Analysis
- Pivot Tables
- Dashboards

Required Soft Skills

- Communication (the single highest-ranked soft skill dataset-wide)
- Analytical Skills
- Coordination
- Attention to Detail

Educational Background

A Bachelor's degree in any stream is genuinely accepted here. Commerce, engineering, statistics, general graduates: they all show up in this candidate pool, more so than for any of the other four roles.

Experience Expectations

Alongside Financial MIS Executive, this is one of the two largest fresher pools on the dashboard. Functionally, it's the easiest entry point in the entire dataset for someone without prior work experience.

Step-by-Step Learning Path

1. Get comfortable with the core four: Excel, SQL, Power BI, and basic data cleaning, before specialising in any one of them.
2. Deliberately practise on data from at least three different functions (sales, HR, finance) so your portfolio doesn't read as narrowly trained.
3. Learn to write a one-page plain-language summary of a dataset for someone who has never seen it. That's quite literally most of the job.
4. Work toward the Microsoft Certified: Power BI Data Analyst Associate (exam PL-300). It's a broad, widely recognised credential that suits this role's generalist nature better than a single-tool certificate would.
5. Take on a cross-functional capstone project that forces you to reconcile numbers from two different source systems that don't naturally agree.
6. If your programme allows it, seek an internship with rotation across departments. It mirrors exactly what this job asks of you day to day.

Recommended Projects

- Consolidate three departments' data (HR attendance, sales, inventory, say) into a single Power BI dashboard with working filters and slicers.
- Build a "new manager's MIS pack": simulate what an MIS Analyst would hand a first-time manager in their first week on the job.

- Take a messy public dataset and produce both an Excel workbook and a Power BI version. Document exactly what you changed and why.

Resume Guidance

Position yourself as versatile, not specialised. List Excel, SQL, Power BI, and Data Analysis together, and call out any cross-functional or multi-department project explicitly. That range is exactly what separates this title from the other four.

Interview Preparation

Expect a live Excel or SQL test alongside a question like: tell me about a time you had to explain data to someone non-technical. Communication is the single most in-demand soft skill in the entire dataset, and for a generalist role specifically, interviewers are testing whether you can translate a number into a decision, not just compute it correctly.

Career Growth Opportunities

MIS Analyst to Senior MIS Analyst to Reporting Analyst to Business Intelligence Analyst to Analytics Manager is the typical reporting-track progression. Because this is the broadest starting point of the five roles, it also keeps a lateral move into any of the other four specialised tracks realistically open for the first two or three years of a career.

4.3.3 Sales MIS Executive

Dashboard fresher openings: 374

Role Overview

Sales MIS Executive is the third-largest fresher entry point on the dashboard, at 374 openings, and the work runs on a faster clock than the other four roles. Daily and weekly target-vs-achievement numbers, pipeline conversion, dispatch and delivery tracking: all built to reach a sales leader before that day's numbers go stale.

Why Commercial Teams Depend on This Role

E-commerce (794 postings) and Logistics (812 postings) both need someone converting raw transaction and dispatch data into numbers a sales or operations leader can act on same-day, and a meaningful share of Manufacturing's hiring works the same way. That's a different cadence from the monthly or quarterly rhythm of Financial MIS, and it's why this title clusters so heavily in commercial, fast-moving sectors.

Industries Recruiting for This Role

- E-commerce
- Manufacturing
- Logistics
- Consulting

Types of Companies Hiring

Still overwhelmingly private-sector, but with a noticeably larger SME (Small and Medium Enterprises) presence than the other four roles. Fast-growing commercial teams, not just large enterprises, tend to run lean, in-house sales-ops functions rather than outsourcing the reporting.

Required Technical Skills

- Excel and Pivot Tables for target-vs-achievement and funnel reporting
- Power BI / Dashboards for territory and product-line views

- CRM platforms, the genuine differentiator for this role. Zoho CRM and Zoho Analytics are the most commonly named tools in Indian entry-level Sales MIS postings, with Salesforce becoming more common at larger employers

Required Soft Skills

- Coordination
- Presentation Skills, more central here than for the other four roles
- Stakeholder Management
- Communication

Educational Background

A Bachelor's degree is the baseline. An MBA in Sales or Marketing is the natural differentiator for candidates aiming at sales-operations leadership rather than staying purely in reporting.

Experience Expectations

374 fresher openings is a real, if more selective, entry point than MIS Analyst or Financial MIS Executive. Expect somewhat sharper competition, and a genuine advantage for candidates who can name a specific CRM platform on their resume rather than generic "reporting" experience.

Step-by-Step Learning Path

1. Build Excel and Power BI fundamentals specifically around target-vs-achievement and funnel reporting, not generic dashboards.
2. Get hands-on with Zoho CRM and Zoho Analytics. Most entry-level postings for this title name a CRM platform directly, and Zoho is the one that shows up most often in the Indian market.
3. Understand how a sales funnel is actually structured (lead, qualified, proposal, closed) so your reports reflect how a sales team thinks, not just raw totals.
4. Practise turning a data table into a presentation-ready summary. This role reports to sales leadership, who read charts and headlines, not spreadsheets.
5. Pick up a free platform certification, HubSpot's sales software certification or a Zoho certification, to put a named credential on your resume.
6. Talk to an actual sales team, if you can, about what numbers they check every morning. Most learning resources teach the tool, not the sales rhythm underneath it.

Recommended Projects

- Build a sales pipeline dashboard showing stage-wise conversion and a target-vs-achievement view broken down by territory.
- Design an incentive or commission calculator that applies a sample slab structure to raw sales data.
- Build a dispatch-to-delivery tracker relevant to e-commerce or logistics-adjacent sales reporting.

Resume Guidance

Name the specific CRM platform you've used or practised on. "Zoho Analytics" is a stronger resume line than generic "dashboarding experience" here, because it matches what postings for this exact title ask for.

Interview Preparation

Be ready to present a sample dashboard out loud, not just describe it. Presentation Skills shows up specifically for this role's soft-skill profile in a way it doesn't for the other four. Expect a question on how you'd explain a missed target to a sales manager without the conversation turning defensive.

Career Growth Opportunities

Sales MIS Executive to Senior Sales MIS Executive to Sales Operations Analyst or Manager is the direct path. There's an alternative branch too, into Business Information Executive-style cross-functional reporting, for candidates who'd rather generalise across departments than stay purely commercial.

4.3.4 Data MIS Executive

Dashboard fresher openings: 314

Role Overview

Data MIS Executive is the most technical of the five roles, and the fourth-largest fresher pool at 314 openings. A standard MIS Executive produces recurring, descriptive reports on a fixed schedule. This title sits deliberately closer to a Data Analyst's exploratory, diagnostic work, and the dashboard's own top-skill data explains why: Python shows up 5,500 times, SQL 8,900.

Why This Role Is Getting More Technical

This is the one role of the five built specifically to absorb Python and SQL demand rather than treat them as optional extras. It's positioned as the natural stepping stone toward a full Data Analyst career, and that distinction matters because employers screen for it differently than they screen for the other four titles.

Industries Recruiting for This Role

- IT Services
- Consulting
- Banking
- EdTech

Types of Companies Hiring

Newage Tech Soln Pvt and Turing, both inside the dashboard's top ten recruiters and both technology-oriented employers, alongside Accenture's data and analytics practice, which hires this profile for client-facing analytics work.

Required Technical Skills

- SQL: joins, aggregations, subqueries. The single most commonly tested skill in screening for this title.
- Python (pandas specifically), for cleaning and reshaping data, not machine learning
- Power BI as the primary BI tool, the more common enterprise standard in Indian firms, with Tableau as a secondary, portfolio-differentiating skill

Required Soft Skills

- Analytical Skills
- Problem Solving
- Attention to Detail
- Communication, translating a technical finding back to a non-technical stakeholder

Educational Background

A Bachelor's degree is the baseline, but a Computer Science, Statistics, or Engineering background carries noticeably more weight here than for the other four roles, given the heavier technical loading.

Experience Expectations

314 fresher openings is real demand, but the second-smallest of the five pools. This is the role where the technical bar is highest for a first-time applicant, so a visible portfolio project matters more here than coursework alone.

Step-by-Step Learning Path

1. SQL first: joins, aggregate functions, subqueries. This is the most commonly tested skill in screening for this specific title.
2. Python next, specifically pandas, for cleaning and reshaping data. This role doesn't require machine learning or modelling.
3. Pick one BI tool to go deep on. Power BI is the more common enterprise standard in Indian firms; treat Tableau as a secondary, differentiating skill rather than a parallel priority.
4. Practise the full pipeline end to end at least twice: raw file, SQL or Python cleaning, dashboard, one-paragraph written insight.
5. Work toward the Microsoft Certified: Power BI Data Analyst Associate (PL-300), and consider a broader credential like the Google Data Analytics Professional Certificate to formalise the SQL and statistics side.
6. Contribute to or replicate an open dataset project and publish it publicly. For this role specifically, a visible portfolio outweighs a strong resume line.

Recommended Projects

- Take a genuinely messy raw dataset, missing values, inconsistent formats, and document a full SQL or Python cleaning pipeline, not just the finished output.
- Automate a report that would otherwise be rebuilt manually every week, using a Python script instead of a copy-paste Excel routine.
- Build both a Power BI and a Tableau version of the same dashboard from a public dataset relevant to IT services or EdTech, and be ready to explain why you'd choose one tool over the other for a given audience.

Resume Guidance

Lead with SQL and Python, by name. For this title specifically, generic "reporting and Excel" phrasing undersells the profile, and it's unlikely to clear the technical screen this role faces that the other four don't.

Interview Preparation

Expect a live SQL query-writing exercise and a case-style data problem where you have to reason about why a number looks off, not just recompute it. This mirrors a broader industry pattern: Data Analyst-adjacent hiring tests diagnostic thinking, not tool fluency alone. Practise narrating your reasoning as you work through a problem.

Career Growth Opportunities

Data MIS Executive to Data Analyst to Business Analyst or Analytics Associate. Of the five roles, this one sits closest to a dedicated data-analytics career track rather than staying inside the MIS reporting function long-term.

4.3.5 Business Information Executive

Dashboard fresher openings: 257

Role Overview

Business Information Executive is the smallest of the five fresher pools, at 257 openings, and functionally the closest of the five to a junior business analyst rather than a department-specific MIS role. The brief is consolidation: pulling information from several business units into one coherent picture for a leadership or client

audience, rather than owning one function's numbers. The technical stack here is deliberately the lightest of the five roles, because the differentiator is synthesis and communication, not tool depth.

Why Consulting-Style Employers Value This Role

Consulting is the dashboard's second-largest industry, at 4,500 postings, and four of the top ten recruiters (Accenture, EY, Deloitte, Ernst & Young) are consulting or professional-services firms. Those employers specifically need people who can synthesise information across departments for a client or internal leadership audience. That's exactly this role's brief, and exactly why it clusters around consulting-style employers rather than single-function teams.

Industries Recruiting for This Role

- Consulting
- Healthcare
- Real Estate
- IT Services

Types of Companies Hiring

Accenture, EY, Deloitte, and Ernst & Young by name, plus any employer running a centralised MIS or reporting function that serves multiple business units at once rather than one department alone.

Required Technical Skills

- Excel
- Reporting
- Data Analysis
- Dashboards
- Power BI
- MS Office

Required Soft Skills

- Communication
- Stakeholder Management
- Presentation Skills
- Organizational Skills

Educational Background

A Bachelor's degree is the baseline, but an MBA or Master's degree carries more weight for this title than for any of the other four, given the consulting-adjacent audience it typically reports to.

Experience Expectations

257 fresher openings makes this the most competitive of the five entry points. Technical depth won't be what differentiates a candidate here. Communication ability and structured thinking will.

Step-by-Step Learning Path

1. Build Excel, Reporting, and Power BI to a competent level, not necessarily expert. The ceiling on tool depth is genuinely lower for this role than for the other four.
2. Practise writing an executive summary: three sentences that tell a senior reader what matters, before a single chart appears.

3. Study the Entry Certificate in Business Analysis (ECBA) syllabus from IIBA, even before attempting the exam. Its requirements-gathering and stakeholder-analysis concepts map directly onto this role's actual work.
4. Practise consolidating conflicting information from two mock "departments" into one coherent recommendation. Arguably the single hardest and most valuable skill for this title.
5. Look for a business-case competition or a consulting-style club project while you're still studying. Hiring for this role leans heavily on demonstrated structured thinking over a tool checklist.
6. Sit the ECBA exam once you can comfortably discuss requirements elicitation and stakeholder analysis. It carries no mandatory experience prerequisite, which makes it realistic to attempt as a fresher.

Recommended Projects

- Build a consolidated "business information pack" for a mock client spanning three functions, finance, operations, and HR, with one executive-summary page up front.
- Take two intentionally conflicting data sources and write a short memo reconciling them with a clear recommendation.
- Design a reusable cross-department reporting template that a non-technical manager could fill in without help.

Resume Guidance

Foreground cross-functional or consulting-style project experience and any written communication samples ahead of a tool list. An interviewer for this role is more likely to ask to see a written summary you produced than to test a formula.

Interview Preparation

Expect a case-style prompt, something like "summarise this messy dataset for a CEO in ninety seconds," rather than a technical skills test. This is the one role among the five where screening genuinely resembles a consulting case interview more than an Excel assessment.

Career Growth Opportunities

Business Information Executive to Business Analyst to Consultant is the most direct route of the five roles into a formal, IIBA-recognised business analysis or consulting career track.

4.4 Job Search Strategy

A job search strategy built on this dashboard looks different from a generic one. It accounts for the fact that most postings favour experience, that most postings don't disclose salary, and that work arrangements skew toward hybrid and on-site rather than remote.

Search Discipline

A job search built on this dashboard looks different in three concrete ways. First, applications should concentrate on the five roadmap roles rather than spreading across the full 20-title field, simply because that's where fresher demand is concentrated. Second, salary-blind screening is a mistake here. Only 21% of postings (10,678 of 50,942) disclose pay, so filtering out listings that don't show a number would eliminate most of the market, not just its low-paying end. Third, work-mode expectations need recalibrating. Among private-sector postings that specify an arrangement, hybrid and on-site together dominate, and remote is a small minority, so a student searching remote-only is working against the grain of this particular market.

Resume Customisation for Different Roles

A generic resume underperforms in a market this specific. The skills section should shift per application to match the target role's actual stack from Section 4.3: a Data MIS Executive application should foreground SQL and Python, while a Financial MIS Executive application should lead with Excel and MIS reporting instead. It's worth naming the target industry explicitly where possible too, "finance reporting for BFSI," for instance, since industry alignment seems to matter in this dataset's hiring pattern, not just title alignment. And rather than applying at random, it helps to keep the dashboard's top recruiters listed by name in a placement tracker, so applications stay concentrated where hiring volume is genuinely highest instead of scattering across an 11,000-company field.

4.5 Salary Planning

The dashboard's average salary (₹3.98 lakh) sits well above its median (₹3 lakh), which points to a right-skewed distribution: a small number of high-paying postings, up to the reported ₹50 lakh ceiling, pull the average up. Students should anchor expectations to the median and the most common salary band of ₹2–5 lakh rather than the average, which overstates what a typical posting actually offers.

Understanding Salary Expectations

₹2–5 lakh is the realistic band for a first MIS role. Figures near the ₹50 lakh ceiling belong to a senior, specialised outlier, not a fresher benchmark, and treating that number as typical sets an expectation the market won't meet. It also helps to build the habit of confirming pay directly with a recruiter rather than assuming a listing without disclosed salary falls outside the typical range. With only 21% of postings showing pay, silence on salary is the norm here, not a warning sign.

Comparing Salaries Across Roles and Experience Levels

Among the five roadmap roles, Financial MIS Executive reports the highest average pay at roughly ₹5.0 lakh, with Sales MIS Executive close behind at around ₹4.6 lakh. MIS Analyst sits near ₹3.0 lakh, close enough to the dataset's overall median to work as a reasonable benchmark for "typical" MIS pay, while Data MIS Executive (~₹1.8 lakh) and Business Information Executive (~₹1.2 lakh) trend lower at entry level. That's useful to know when weighing multiple offers instead of taking the first one that shows up. Pay rises with experience overall, but not smoothly. The steepest step-up happens beyond the 3–5 year mark, so early-career planning should focus on getting there efficiently rather than expecting fresher-level pay to climb in a straight line year on year. Industry matters just as much as role. Banking averages roughly ₹8.4 lakh, well ahead of Consulting (~₹5.1 lakh) and Manufacturing (~₹4.6 lakh), which backs up Section 4.1's industry guidance from a pay angle as well as a volume one.

A Location Insight Worth Acting On

The dashboard's city-level salary data shows several tier-2/3 industrial hub locations with unusually wide salary ranges, shown below. These most likely reflect a handful of senior or plant-specific postings concentrated in each city rather than a typical entry-level figure. But they still signal that students defaulting only to metro searches may be missing above-average opportunities in industrial clusters.

City	Reported Salary Range
Bawal	₹17.0L – ₹29.0L
Neemrana	₹13.0L – ₹25.0L
Bhillai	₹18.0L – ₹24.0L
Angul	₹18.0L – ₹24.0L
Durgapur	₹15.0L – ₹24.0L

City	Reported Salary Range
Gorakhpur	₹10.0L – ₹24.0L
Jammu	₹9.0L – ₹20.0L
Silvassa	₹5.9L – ₹24.0L

Long-term financial planning should follow the same logic as career planning. Use the role-specific growth path from Section 4.3 as the target trajectory, and revisit salary expectations at each stage against the dashboard's own experience-based pattern rather than outside, non-dataset benchmarks that may not fit this particular market.

5. Solution for ACC

Where Section 4 gives students a way to act on the dashboard individually, this section gives ACC a way to act on it institutionally: training design, curriculum, placement operations, counselling, and ongoing decision-making.

5.1 Training Program Design

Curriculum decisions should start from the top ten technical skills in Section 4.2, not a generic analytics syllabus, because that ranking is what makes sure graduates carry the specific tool combination that actually shows up across 29,769 technical-skill mentions in the dataset. It isn't a guess at what might be useful. The same logic applies to case studies and guest content: Banking, Consulting, and Manufacturing deserve disproportionate representation, and the dashboard's ten named recruiters are worth featuring by name rather than referenced generically. Most importantly, training should prepare students for the five specific in-demand roles identified in Section 4.3, not for "an MIS career" as one undifferentiated thing. A student trained generically has, in practice, been trained for none of the five particularly well.

5.2 Curriculum Enhancement

Role-based tracks should mirror the five roadmaps directly, so a student can choose a Financial MIS, Sales MIS, Data MIS, or Business Information path instead of sitting through one undifferentiated MIS course that serves none of them well. The average of 8.36 skills per posting is worth treating as a design floor. Each track's curriculum should stack enough tools to meet or beat that bar, not stop at two or three foundational skills and call the module done. The project bank should come directly from the "Recommended Projects" lists in Section 4.3, so coursework doubles as placement-ready portfolio material instead of disposable classroom exercise. Interview preparation should follow the same principle: Excel and SQL practical tests, not purely conceptual interviews, since that's the screening pattern the market actually uses, given how dominant those two skills are across postings.

5.3 Placement Planning

Placement activities, training priorities, and employer engagement work better as one coordinated effort than as three separate workstreams. A training cycle should feed directly into outreach for the same roles and the same companies, instead of the two running on separate calendars. Direct outreach to the dashboard's top ten recruiters for campus drives and hiring tie-ups is probably the highest-leverage use of a placement team's limited time, since those employers already represent the biggest concentration of demand in the dataset. Drives should be sequenced around Banking, Consulting, and Manufacturing first, not spread evenly across all 26 industries the data covers. The return on effort just isn't uniform across a field this fragmented. It's also worth setting realistic student expectations around work mode during drive planning: hybrid and on-site opportunities will dominate, and a remote-only employer commitment should be treated as the exception, not something to plan around as the default. Finally, extending placement partnerships into the tier-2/3 industrial clusters from Section 4.5 deserves real follow-up, since the salary data there suggests genuine opportunity beyond what is likely ACC's current, more metro-centric network.

5.4 Career Counselling

The five role roadmaps in Section 4.3 work well as the counselling script itself, moving a student off a generic "MIS Executive" ambition and into whichever of the five roles actually fits their skill profile and interests. The

salary-planning findings in Section 4.5, the gap between median and average, the ₹2–5 lakh common band, are worth introducing early in counselling conversations specifically to set realistic pay expectations, since student frustration and attrition often trace back to anchoring on the dataset's outlier salary figures rather than its typical ones. The 85.1% experienced-hiring finding is worth surfacing early too. It's the clearest argument for pushing students toward internship and on-the-job-training exposure well before graduation, since that's what compresses the experience gap the data shows most postings actually require.

5.5 Data-Driven Decision Making

Every major ACC decision covered in this section, which skills to teach, which companies to court, which roles to counsel students toward, should stay traceable to a specific dashboard figure, the same way every recommendation in this report has been tied back to a number instead of asserted generically. That discipline only holds if it's treated as ongoing, not a one-time exercise. Job-market insights should be re-analysed on a recurring basis, not filed away after a single report, since the underlying scraped dataset itself refreshes on a continuing cycle and deserves the same attention each intake period. Emerging skill gaps are easiest to catch by comparing each cohort's actual skill coverage against the ranked lists in Section 4.2, updated every cycle rather than left as a one-off benchmark. And any gap between what ACC currently teaches and what a refreshed dashboard shows should be treated as the trigger for curriculum revision in its own right, rather than waiting for a fixed annual review to catch up with a market that doesn't move on an annual schedule.

6. Implementation Framework

The phased plan below sequences Sections 4 and 5 into something that can actually be rolled out, with each phase tied back to the dashboard evidence that justifies it.

Phase	Timeline	Focus Area	Action	Dashboard Basis
Phase 1	Weeks 1–4	Dashboard-to-Curriculum Audit	Map existing ACC training content against the top 10 technical and soft skill lists; identify gaps per role track.	Skill demand tables
Phase 2	Weeks 5–10	Role-Based Track Rollout	Launch five dedicated learning tracks, one per roadmap role, with embedded suggested projects.	Career Roadmap (Section 4.3)
Phase 3	Weeks 11–14	Placement Readiness	Run resume workshops per role, mock interviews, and targeted outreach to the top 10 recruiters and top 3 industries.	Top companies / industries tables
Phase 4	Ongoing	Monitoring & Refresh	Track placement outcomes by role, industry, and city; refresh the dashboard every intake cycle.	Full dashboard

7. Expected Outcomes

7.1 For Students

- Better career planning, grounded in the five roles the dashboard shows are genuinely accessible at fresher level, not the full 20-title field.
- Stronger industry-relevant skills, built against the ranked technical and soft skill lists instead of a generic curriculum.
- Better interview readiness, practised against the specific screening patterns (Excel/SQL tests, stakeholder scenarios) the data suggests employers actually use.
- Higher placement odds, from concentrating search effort on the roles, industries, and companies where the dashboard shows real fresher demand.

7.2 For ACC

- Training better aligned with industry needs, curriculum mapped directly to the dashboard's top skill rankings.
- A sharper placement strategy, drives and outreach sequenced around the highest-demand industries and named recruiters.
- Stronger recruiter relationships, built through targeted, repeated engagement with the dashboard's top ten employers instead of diffuse outreach.
- More informed placement planning, with every decision traceable to a dashboard figure, which makes for more confident conversations with students and employer partners alike.

9. Conclusion

The MIS Job Market Dashboard shows a job market that's large in absolute terms, 50,942 postings across 11,322 companies, but narrow and specific in the paths it actually offers a fresh graduate. Five roles account for most of fresher demand. Three industries account for most of the hiring. Ten employers dominate the top of the recruiter list. A defined set of ten technical and ten soft skills recur across nearly every posting.

Used the way this report has used it, the dashboard becomes a decision-support tool rather than a static snapshot. It tells students which of the 20 MIS titles to pursue and how to prepare for it. It tells ACC which skills to teach, which employers to court, and which students need which kind of support. That's what closes the gap between what industry actually requires and how prepared ACC's students are to meet it. Keeping this report's recommendations tied to the dashboard's numbers, and refreshing both as new data comes in, is what will keep ACC's placement support accurate as the market keeps moving.
